

Order Emails, Checkout Regions & Address Presentation

Deployment report — trovemo.com · 2026-08-02 · master 86f7fc421 + 0c2023549 · prod schema V48 · status: **DEPLOYED & LIVE**

1 · Summary

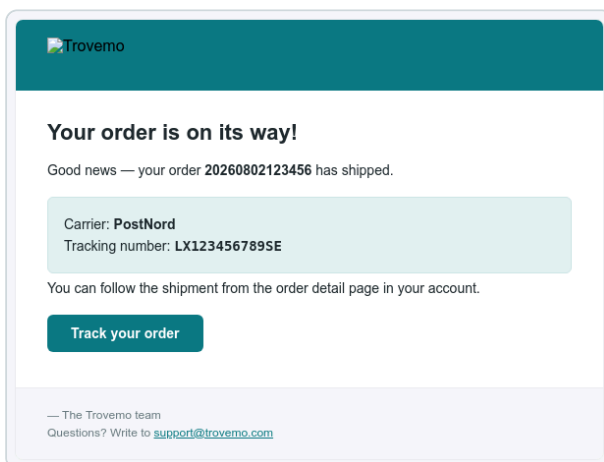

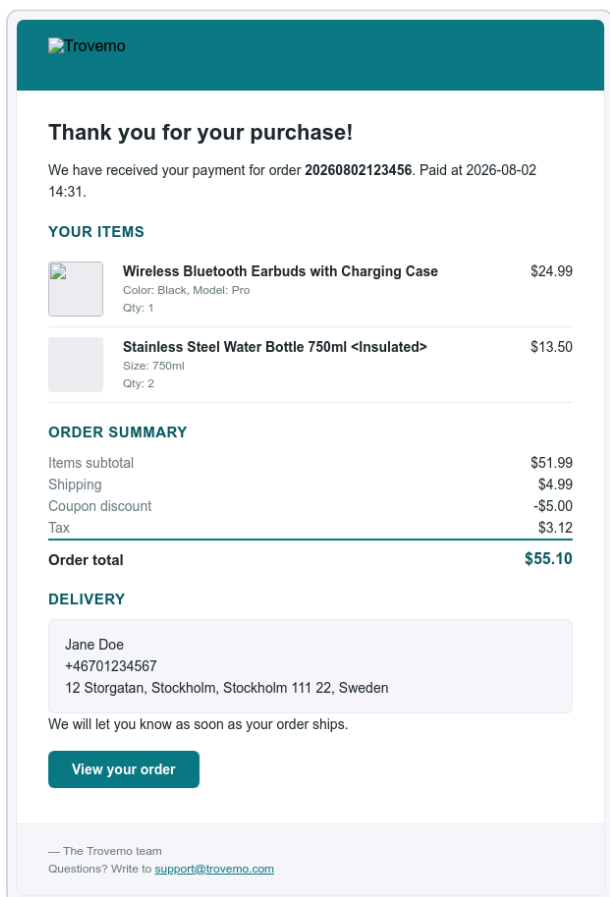

This wave delivers three customer-facing improvements, live in production since 2026-08-02:

- **Branded HTML order emails** — customers now receive a classic order-confirmation email (Trovemo logo, product photos, line items, totals breakdown, delivery address, view-order button) when their payment lands, and a shipping email carrying the CJ tracking number, including a follow-up when CJ assigns the number late.
- **Phone-driven region selection at checkout** — the country picked in the phone dial-code selector pre-fills the destination country, and the Region field becomes a type-ahead over that country's real states/regions (previously: a dropdown hardcoded to four Swedish regions for every country).
- **Readable delivery addresses** — orders store a structured "street, city, region zip, Country" snapshot (postal code finally included); the confirmation page gains a "Delivering to" card and the order-detail page shows clean stacked address lines.

Customer email is **ON in production**: Brevo SMTP credentials verified, domain fully authenticated (SPF / DKIM / DMARC), and a test email delivered to the owner's Gmail **inbox** (not spam). Password-reset emails are activated by the same credentials.

2 · The emails

Rendered by the production templates (screenshots from the verification run):

- Multipart delivery: HTML plus a plain-text fallback in every mail (inspected in MailHog: `multipart/alternative` , text 663 B + HTML 6.2 KB).
- Logo hosted at `https://trovemo.com/mail-logo.png` (white wordmark on the teal header; byte-verified live).
- Product thumbnails absolutized from the store's CDN paths so they render in mail clients.
- Blank-tracking case renders "Your tracking number is being assigned — we will send it in a follow-up email." — never an empty line.
- Recipient is the account email; guest checkout already captures it at checkout (Wave 15/16).

3 · Defects found and fixed while building

Defect	Impact	Fix
Shipped-order event published with no transaction; the mail listener only fires after a commit	Shipping emails would never have been sent, on either ship path (CJ sync or admin)	<code>shipOrder</code> made transactional
CJ can report SHIPPED before assigning a tracking number	Order shipped with an empty tracking number, never updated	Late-tracking backfill: number is stamped on the order when CJ provides it and the tracking email fires then
Order address stored as an unseparated concatenation without postal code	"StockholmStockholmStockholm 12 Main St" shown to customers	Structured snapshot with separators, deduplication, zip and country (column widened to 255)
litemall-core compiled against an obsolete javax mail line (pulled in by the jHipster BOM)	HTML mail code could not compile	Core pinned to the Spring 6 (jakarta) line the services already run

4 · Schema change (V48)

Table	Change	Purpose
<code>litemall_mail_outbox</code>	+ <code>body_html</code> MEDIUMTEXT NULL	HTML alternative; plain <code>body</code> stays the fallback and admin-panel view
<code>litemall_address</code>	+ <code>country_code</code> VARCHAR(8) NULL	Destination country persists with the address book
<code>litemall_order</code>	<code>address</code> 127 → 255 chars	Structured snapshot with zip + country no longer fits 127 reliably

Applied in production at order-service boot: *"Migrating schema litemall to version 48 — Successfully applied 1 migration, now at v48"*.

5 · Checkout & SPA changes

- Phone selector exposes its country; destination country shows for every cart, follows the phone country until chosen explicitly, and is restored from saved addresses.
- Region type-ahead backed by a static dataset covering the 8 supported shipping countries (US, GB, SE, NO, DE, FR, CA, AU — all US states, German Länder, Swedish län, ...). Free text remains valid everywhere; no external service.
- City/Kommune became a free-text field; Google Places autocomplete (when configured) fills city/region/zip and now also the country.
- Address book editor gained the same country selector and region suggestions.

- Confirmation page: new "Delivering to" card. Order detail: stacked address lines (legacy orders keep rendering as a single line).

6 · Email infrastructure (Brevo)

Item	Value / status
SMTP relay	smtp-relay.brevo.com:587 (STARTTLS + auth) — login verified: 235 Authentication succeeded
SMTP login	b3603b001@smtp-brevo.com (key stored only in .env.prod on the VPS)
Sender	noreply@trovemo.com
SPF	OK — include:spf.brevo.com present
DKIM	OK — brevo1 / brevo2 selectors resolve
DMARC	OK — policy published
Inbox test	Delivered to Gmail INBOX (not spam), via the exact production sender code
Also activated	Password-reset emails (edge sender, same credentials)

7 · Verification record

Check	Result
Order-service test suite (incl. updated mail tests)	GREEN — all tests pass with real run counts (mail suite 11/11)
MIME structure in MailHog	multipart/alternative, plain + HTML parts confirmed
Template rendering (headless Chrome)	Both emails render as designed (screenshots above)
SPA type-check & production build	Clean on all touched files
Prod: V48 migration	Applied (47 → v48)
Prod: containers	order + gateway-api recreated, healthy (order first — it carries the migration)
Prod: mail-logo.png	200, byte-identical to the build artifact
Prod: new checkout live	Region type-ahead strings + regions dataset confirmed in the served bundles

8 · Follow-ups

- **Observe the first real paid order:** confirm the confirmation email arrives and renders with images. The admin Mail outbox panel shows every row and any delivery error.
- Rotate the Brevo **API** key that was shared in chat (the deployed SMTP key lives only in .env.prod ; rotating either is one click + an env update).
- Expanding beyond the 8 shipping countries later = edit one shared list + region dataset, and verify freight templates for the new codes.
